

TVA Trajectory: CO₂ and a Cleaner Future

Joe Hoagland

April 3, 2015

Where We are Today.....

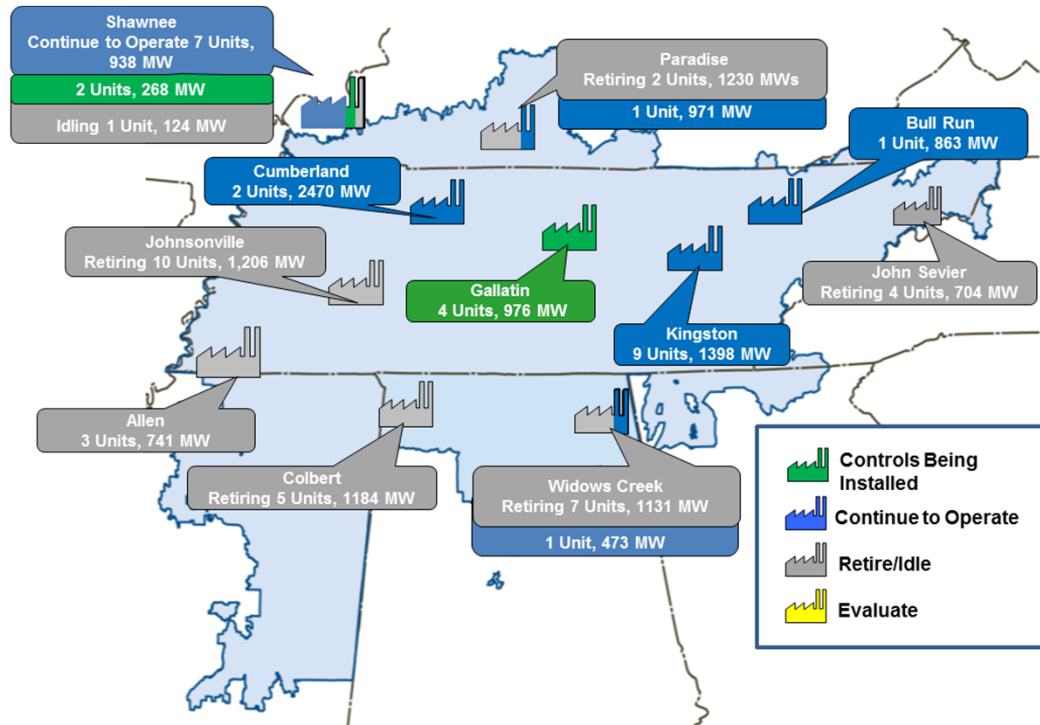

EPA's Proposed "Clean Power Plan"

- **President's Climate Action Plan instructed EPA to regulate CO₂ emissions from existing power plants under CAA section 111(d)**
- **June 2, EPA released the Proposed "Clean Power Plan"**
 - **EPA's proposal defines the "Best System of Emission Reductions"**
 - **EPA is defining the "system" broadly as the state's electrical system**
 - **Sets Emission Guidelines on a state-by-state basis for existing fossil units (lbs CO₂/MWh)**
 - **EPA starts with a 2012 baseline for fossil emissions and generation**
 - **Many early actions that have reduced CO₂ emissions are being used by EPA to establish more stringent emission guidelines**

US Total CO₂ Emissions historical data is sourced from Energy Information Administration's (EIA) Annual Energy Review 2011
US Total CO₂ Emissions projected data is sourced from EIA's Annual Energy Outlook 2013

TVA's Coal Fleet: Current Status

- TVA plans to operate ~8,000 MW of coal capacity in its balanced portfolio (27 units at 7 plant sites)
- TVA plans to complete retirement of ~6,320 MW of coal capacity by 2024 (32 units at 7 plant sites)

Note: MW reflect summer net capability consistent with TVA's 10-k; chart reflects Aug 2014 Board decision to build gas plant at Allen and controls at Shawnee units 1 and 4..

TVA CO₂ Emissions

- Through 2012, TVA has achieved a 28% reduction in CO₂ levels from a peak in 1995
- CAP Goal: Reduce CO₂ emissions 17% below 2005 levels by 2020
- Through 2012, TVA has reduced CO₂ emissions 23% below 2005 levels

TVA is projected to reduce CO₂ emissions 40% below 2005 levels by 2020

Projections based on PaR outputs FY15 sPSP

TVA CO₂ Emissions and Progress for our Customers

- TVA has made asset decisions that have reduced CO₂ emissions
- TVA has reduced CO₂ emissions 30% below 2005 levels
- TVA is projected to reduce CO₂ emissions 40% below 2005 levels by 2020
- TVA delivers electric power containing around 1100 lbs/MWh and is on track improve that to around 700lbs/MWh by 2020
- TVA provides an attractive combination of price (¢/kWh) and carbon content (lbs/MWh)

20 Years From Now

The Future of Our Energy Supply

- TVA power will still be reliable, affordable and sustainable
- We will rely more on cost-effective energy efficiency
- There will be more solar and wind power, and less coal
- Natural gas will play a bigger role
- TVA will continue to provide for economic growth in the Tennessee Valley

TVA's Mission is the Cornerstone

Energy

Environment

Economic
Development

ASSET PORTFOLIO:
meet reliability
expectations &
provide a
balanced portfolio

The Role of the IRP at TVA

The IRP Is ...

- A planning study
- Used to identify the least cost power supply mix
- Designed to evaluate future uncertainty

The IRP Does Not ...

- Set rates
- Identify sites for new generating units
- Provide all the answers we need

Stakeholder & Public Involvement Throughout the Process

Our public engagement includes:

- A stakeholder working group
- Policy advisory groups
- Customers & Valley residents

Fall 2013

Input will be incorporated throughout the process

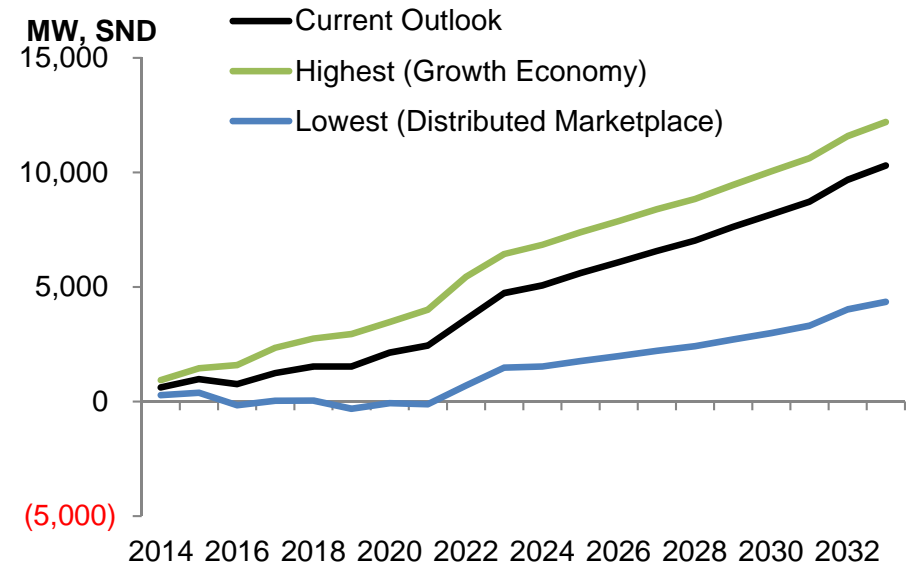

Spring 2015

Why the Need to Look Forward

- The **capacity gap** is the difference between the need for power and today's resources
- The amount of new capacity needed will range from **4,400 to about 12,000 MW by 2033**

Projected Capacity Gap

Scenario and Strategy Planning

External Factors Shaping the Environment

Scenarios

1 - Current Outlook

2 - Stagnant Economy

3 - Growth Economy

4 - De-Carbonized Future

5 - Distributed Marketplace

TVA's Response & Portfolio Goals

Strategies

A - The Reference Plan

B - Meet an Emissions Target

C - Focus on Long-Term,
Market-Supplied Resources

D - Maximize Energy Efficiency

E - Maximize Renewables

A Unique Addition to the IRP

EE as a Resource

**Plant built in
10 MW blocks**

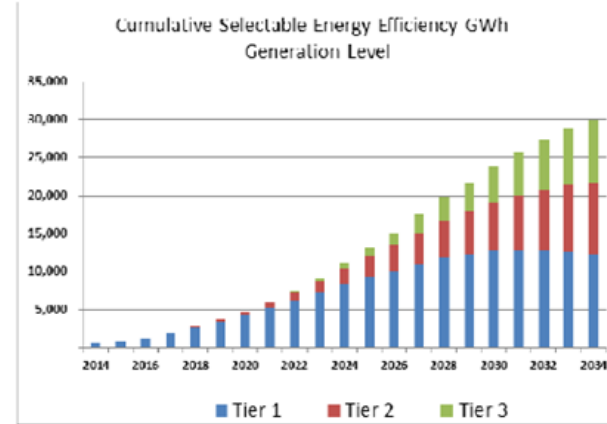

Block Characteristics:

- Capacity factor equivalent
- Load Shape
- Cost to build program
- Time to implement
- Lifetime of Program
- Installed Cost / kwh

◆ Three Primary Sectors: Residential, Commercial, Industrial

What are the Blocks

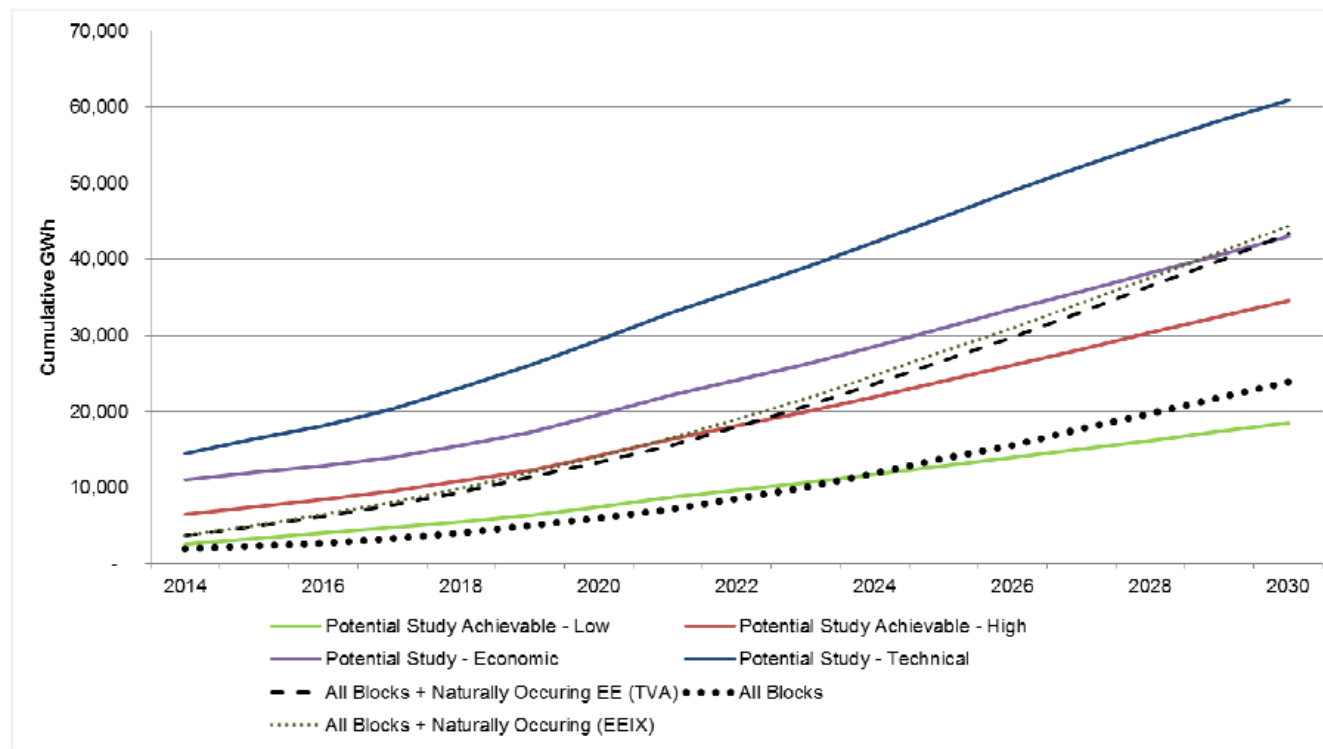

Block Parameters	Residential	Commercial	Industrial
MW per Block	10	10	10
GWh per Block	50	59	72
Ramp Rate (Yr 1 - 5)	25%	25%	25%
Ramp Rate (Yr 6 -15)	20%	20%	20%
Ramp Rate (Yr ≥16)	15%	15%	15%
Max Blocks per Year	23	12	8
Lifespan Tier 1	17	15	12
Lifespan Tier 2	13	13	10
Lifespan Tier 3	13	13	10
Initial Cost Ranges (Millions)	\$20.7 to 38.0	\$11.6 to 33.4	\$11.5 to 33.0

Block Load Shapes

Alignment with Valley Potential Study (Generation Level Savings)

Note: Potential Study Source – Tennessee Valley Authority Energy Efficiency Potential Study 2012 Update, EnerNOC Utility Solutions Consulting, Report No. 1360.2

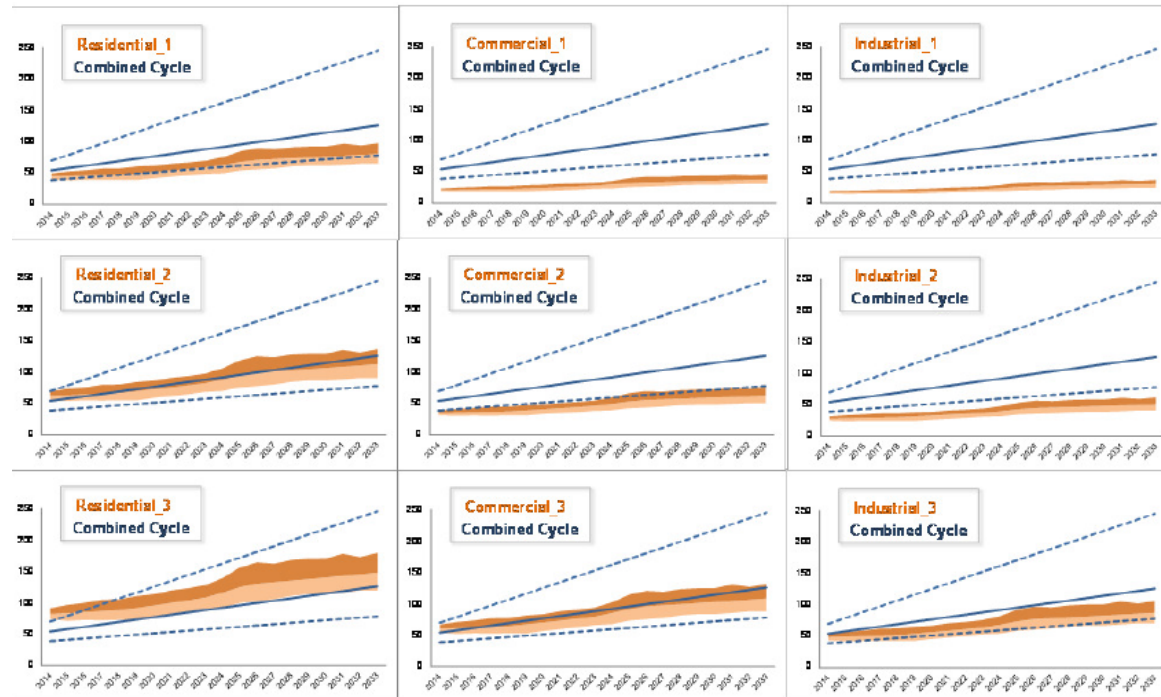

Considering Risk & Uncertainty

- Risk is about forecasting what the cost of a cup of coffee will be 20 years from now
- Uncertainty is about predicting whether or not the coffee will even be available 20 years from now
- We address both of these factors when choosing the least-cost option

EE Cost Uncertainty is less than the Cost Uncertainty of a Combined Cycle

- ◆ The EE uncertainty band is driven cost uncertainty on the escalation rate over time
- ◆ The uncertainty band around CC costs are much wider due to fuel, emissions, O&M, capacity factor, and capital cost uncertainty

55

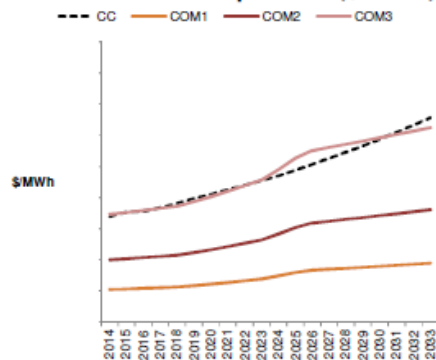

All-In EE Levelized Costs after Planning Adjustment

- ◆ Most of the EE blocks remain cheaper than a natural gas combined cycle (CC) unit over the study period

2015 & 2033
Energy Cost Comparison

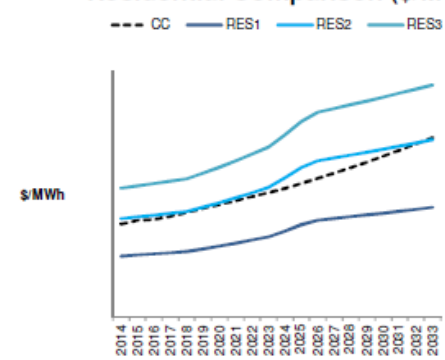

Commercial Comparison (\$/MWh)

Industrial Comparison (\$/MWh)

Residential Comparison (\$/MWh)

*CAGR= 3% for each of the sectors

What have We Seen....

The Generation Fleet Will Be Cleaner

Potential Capacity Mix Under Current Planning Scenario

Resource Types

- Nuclear
- Coal
- Hydro
- Natural Gas
- Renewables
- Energy/Efficiency Demand Response

Non-emitting sources account for 60% to 75% of the energy supply

CO₂ Emissions Typical of Study Trends

CO₂ Emissions by Alternative Strategy

Strategies				
A - The Reference Plan	B - Meet an Emissions Target	C - Focus on Long-Term Market Supplied Resources	D - Maximize Energy Efficiency	E - Maximize Renewables

Observations and Challenges for a Cleaner Future

- Maintaining a balanced Portfolio
- Managing Energy Efficiency and Renewables as a Resource
- Managing the evolution of a Distributed Grid
- Support a clean energy future with policies that maintain reliability and competitive pricing
